# Algebra I - Summer Assignment

# Section 1 - Order of Operations

The order of operations in mathematics is a set of rules to follow to determine which operation to do first when there are different operations within a single problem. The order to perform combined operations is called the **PEMDAS** rule. A common mnemonic for **PEMDAS** is **Please Excuse My Dear Aunt Sally**.

- Always work on the calculations within parenthesis first (if any)
- Next, calculate the exponents
- Then, carry out multiplication or division, working from left to right
- Lastly, do addition and subtraction, working from left to right

#### Example 1

Evaluate 
$$16 - 8 \div 2^2 + 14$$
.  
 $16 - 8 \div 2^2 + 14 = 16 - 8 \div 4 + 14$  Evaluate powers.  
 $= 16 - 2 + 14$  Divide 8 by 4.  
 $= 14 + 14$  Subtract 2 from 16.  
 $= 28$  Add 14 and 14.

#### Example 2

#### Evaluate each expression. a. $4 \div 2 + 5(10 - 6)$ $4 \div 2 + 5(10 - 6) = 4 \div 2 + 5(4)$ Evaluate inside parentheses. = 2 + 5(4)Divide 4 by 2. = 2 + 20Multiply 5 by 4. = 22Add 2 to 20. b. $6[32 - (2+3)^2]$ $6[32 - (2+3)^2] = 6[32 - (5)^2]$ Evaluate innermost expression first. = 6[32 - 25]Evaluate power. = 6[7]Subtract 25 from 32. = 42Multiply.

#### Section 2 - Fractions

We use fractions or ratios every day. A fraction is part of an entire object. It consists of two numbers, a number on the top called a numerator and a number on the bottom called a denominator. To add or subtract a fraction, you must have a common denominator.

- Find the Least Common Denominator (LCD) of the fractions
- Rename the fractions to have the LCD
- Add (or subtract) the numerators
- Keep the LCD
- Simplify the fraction

#### Example 1

# Find each sum or difference. Write in simplest form. a. $\frac{1}{2} + \frac{2}{3}$ $\frac{1}{2} + \frac{2}{3} = \frac{3}{6} + \frac{4}{6}$ The LCD for 2 and 3 is 6. Rename $\frac{1}{2}$ as $\frac{3}{6}$ and $\frac{2}{3}$ as $\frac{4}{6}$ . $= \frac{3+4}{6}$ Add the numerators. $= \frac{7}{6} \text{ or } 1\frac{1}{6}$ Simplify. b. $\frac{3}{8} - \frac{1}{3}$ $\frac{3}{8} - \frac{1}{3} = \frac{9}{24} - \frac{8}{24}$ The LCD for 8 and 3 is 24. Rename $\frac{3}{8}$ as $\frac{9}{24}$ and $\frac{1}{3}$ as $\frac{8}{24}$ , $= \frac{9-8}{24}$ Subtract the numerators. $= \frac{1}{24}$ Simplify. c. $\frac{2}{5} - \frac{3}{4} = \frac{8}{20} - \frac{15}{20}$ The LCD for 5 and 4 is 20. Rename $\frac{2}{5}$ as $\frac{8}{20}$ and $\frac{3}{4}$ as $\frac{15}{20}$ , $= \frac{8-15}{20}$ Subtract the numerators. $= \frac{7}{20}$ Simplify.

#### Section 2 - Exercises

Find each sum or difference. Write your answer in simplest form. (Leave as an improper fraction.)

	11. $\frac{13}{20} - \frac{2}{5}$	11. $\frac{13}{20} - \frac{2}{5}$ 12. $\frac{5}{6} - \frac{8}{9}$

To multiply fractions, multiply the numerators and multiply the denominators. If the numerators and denominators have common factors, you can simplify before you multiply by cross canceling.

# $Section \ 3-Real \ Number \ Comparison$

An inequality is a mathematical sentence that compares the value of two expressions using an inequality symbol.

Inequality Symbol	Pronounced	Example
<	Less than	4 < 9
<b>≤</b>	Less than or equal to	-3 ≤ 2
>	Greater than	-4>-7
≥	Greater than or equal to	5≥5
<b>≠</b>	Not equal to	7 ≠ 11

#### Example 1

Which one is greater,  $\frac{4}{9}or\frac{5}{12}$ ?

Rewrite each fraction using the LCD.

$$\frac{4}{9} = \frac{16}{36}$$
 and  $\frac{5}{12} = \frac{15}{36}$ 

$$\frac{16}{36} > \frac{15}{36}$$
 So  $\frac{4}{9} > \frac{5}{12}$

# Section 5 - Evaluating Algebraic Expressions

A *variable* is a letter that represents an unspecified number. To evaluate an algebraic expression, replace the variables with their values. Then find the value of the numerical expression using the order of operations.

#### Example 1

Evaluate 
$$3x^2 + (2y + z^3)$$
 if  $x = 4$ ,  $y = 5$ ,  $z = 3$ .  
 $3x^2 + (2y + z^3)$   
 $= 3(4)^2 + (2 \cdot 5 + 3^3)$  Replace  $x$  with 4,  $y$  with 5, and  $z$  with 3.  
 $= 3(4)^2 + (2 \cdot 5 + 27)$  Evaluate  $3^3$ .  
 $= 3(4)^2 + (10 + 27)$  Multiply 2 by 5.  
 $= 3(4)^2 + (37)$  Add 10 to 27.  
 $= 3(16) + 37$  Evaluate  $4^2$ .  
 $= 48 + 37$  Multiply 3 by 16.

# Section 6 - Solving One-Step Equations

In an equation, the variable represents the number that satisfies the equation. To solve an equation means to find the value of the variable that makes the equation true. You will only need to perform one step in order to solve a **one-step** equation.

The strategy for getting the variable by itself involves using opposite operations. The most important thing to remember in solving a linear equation is that whatever you do to one side of the equation, you MUST do to the other side.

#### Example 1

-2 = k - 14	Solve
-2+14=k-14+14	Since 14 is subtracted from $k$ , you must add 14 to <b>each</b> side of the equation
12 = k or $k = 12$	Answer

#### Example 2

$\frac{x}{-7} = 15$	Solve
$(-7)\frac{x}{-7} = 15(-7)$	Since $x$ is divided by $-7$ , you must multiply <b>both</b> sides by $-7$
x = -105	Answer

#### Example 3

$\boxed{\frac{3}{4}u = -24}$	Solve
$\boxed{\left(\frac{4}{3}\right)\frac{3}{4}u = -24\left(\frac{4}{3}\right)}$	Multiply both sides by the reciprocal of $\frac{3}{4}$ and cancel any common factors
u = -32	Answer

## Section 7 - Measures of Central Tendency

In working with statistical data, it is often useful to determine a single quantity that best describes a set of data. The best quantity to choose is usually one of the most popular measures of central tendency: mean, median, mode, or range.

Mean The mean is the sum of the data items in a set divided by the number of data items in the set.

Median The median is the middle value in a set of data when the numbers are arranged in numerical order. If the set has an even number of data items, the median is the mean of the two middle

data values.

**Mode** The mode is the data item that occurs most often in a set of data.

Range The range is the difference between the greatest and least values in a set of data.

#### Example 1

Set of data: 34, 46, 31, 40, 33, 40, 35

In order: 31, 33, 34, 35, 40, 40, 46

# Section 8 - Plotting on the Coordinate Plane

You can graph points on a coordinate plane. Use an ordered pair (x, y) to record the coordinates. The first number in the pair is the *x-coordinate*. The second number is the *y-coordinate*. To graph a point, start at the origin (0, 0). Move **horizontally** according to the value of x. Then move **vertically** according to the value of y.
